The Project Audio-Miner

Adaptive signal
representations
Time-frequency
Multipliers
Sparsity and
structured
representations

LOCATIF: Local aspects of time-frequency analysis.

The Project Audio-Miner

Adaptive signal
representations
Time-frequency
Multipliers
Sparsity and
structured
representations

LOCATIF: Local aspects of time-frequency analysis.
Investigation of analysis systems (frames) that allow for local adaptation, e.g. nonstationary frames, quilted frames.

The Project Audio-Miner

Adaptive signal
representations
Time-frequency
Multipliers
Sparsity and
structured
representations

LOCATIF: Local aspects of time-frequency analysis.

Investigation of analysis systems (frames) that allow for local adaptation, e.g. nonstationary frames, quilted frames.

AudioMiner: Applications of results in MIR:

Detection, classification and processing of sound objects

Mathematics \longleftrightarrow MIR - both ways!

The Project Audio-Miner

Adaptive signal
representations
Time-frequency
Multipliers
Sparsity and
structured
representations

- Central question: Can mathematics help improve methods in MIR & can "feed-back" from MIR improve mathematical models.

The Project Audio-Miner

Adaptive signal
representations
Time-frequency
Multipliers
Sparsity and
structured
representations

- Central question: Can mathematics help improve methods in MIR & can "feed-back" from MIR improve mathematical models.
- Particular focus on identification and extraction of sound objects from (polyphonic) audio

The Project Audio-Miner

Adaptive signal
representations
Time-frequency
Multipliers
Sparsity and
structured
representations

- Central question: Can mathematics help improve methods in MIR & can "feed-back" from MIR improve mathematical models.
- Particular focus on identification and extraction of sound objects from (polyphonic) audio
- Three central mathematical themes:
 - Adaptive signal representations
 - Time-frequency Multipliers
 - Sparsity and structured representations

The Project Audio-Miner

Adaptive signal
representations
Time-frequency
Multipliers
Sparsity and
structured
representations

- Central question: Can mathematics help improve methods in MIR & can "feed-back" from MIR improve mathematical models.
- Particular focus on identification and extraction of sound objects from (polyphonic) audio
- Three central mathematical themes:
 - Adaptive signal representations
 - Time-frequency Multipliers
 - Sparsity and structured representations
- MIR tasks: identification, extraction & classification of sound objects

Multipliers
Sparsity and
structured
representations

The Project Audio-Miner

Adaptive signal
representations
Time-frequency
Multipliers
Sparsity and
structured
representations

- Project duration: 3 years (2010-2012)

- Partners: Digital Music group at Queen Mary University,
London (Simon Dixon)
LATP University Marseille (Bruno Torresani)

The Project Audio-Miner

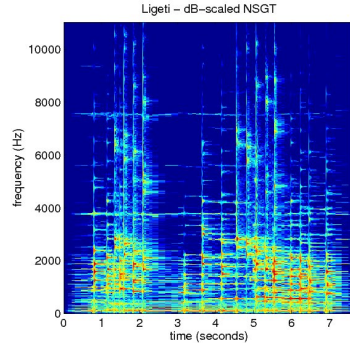

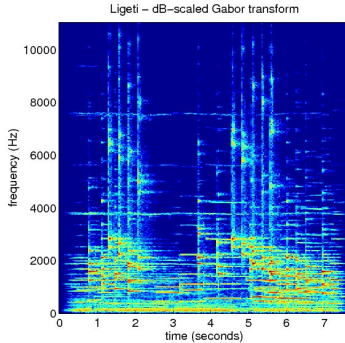

Adaptive signal
representations
Time-frequency
Multipliers
Sparsity and
structured
representations

- Project duration: 3 years (2010-2012)
- One PostDoc (mathematician) at Nuhag, one PostDoc at OFAI
 - Martin Gasser (OFAI): 2010 (Music Similarity, Hubs)
 - Gino Velasco (NuHAG): January-July 2010 (Adaptive representations)
 - Ewa Matusiak (currently: Technion, Haifa): September 2010-2012 (Theoretical aspects of adaptivity)
 - Thomas Grill (currently at Ircam): 2011, 2012 (half-time) (spectro-temporal aspects of similarity, textures)
 - Arthur Flexer (similarity, classification)
 - Kai Siedenburg (structured sparsity in audio)
- Partners: Digital Music group at Queen Mary University, London (Simon Dixon)
LATP University Marseille (Bruno Torresani)

Kai Siedenburg and Monika Drfler: *Structured Sparsity for Audio Signals*, DAFx-11, Paris (2011)

- Regression problems with mixed-norm priors on time-frequency coefficients lead to structured, sparse representations of audio signals.
- Systematic formulation of thresholding operators allows for weighting in the time-frequency domain
- Related iterative algorithms are evaluated on synthetic and real-life audio signals in the context of denoising and multi-layer decomposition.
- Results on the influence of the shape of the weighting masks
